

The positions of the Earth-contact in CEE Sockets in relation to Voltage and Frequency rating.

NB
Unless otherwise indicated, frequency is 50- 60 Hz

The **WACO CEE Clock** shows, in graphic form, the different positions of the Earth sleeve in **CEE Sockets** for different voltage and frequency ratings. For easy identification, looking into a socket from the front, these positions are the same as the hour marks on a clock-face, with the key-way at 6 o'clock.

The Earth-pins are also thicker than the phase and neutral pins: these two safety-features enable a user to see at a glance the rating of any socket and also prevent a plug being inserted in a wrong voltage socket.
